When choosing an Samsung/Sony charger, pay attention to power, voltage, current, and plugs in set

You'll minimize downtime by following a few simple rules outlined in this paragraph.

Remember!

You can read the basic parameters from the **label** located on the bottom of the laptop labeled as **INPUT** or on the rating plate of the original charger labeled as **OUTPUT**. These will be: **POWER** (W), **VOLTAGE** (V), **CURRENT** (A). The following points will dispel any doubts that may arise when choosing equipment:

1. **POWER** (W) **-** this number indicates the **minimum value** that the new charger should have. There's no harm in using a product with **higher power**. This will make it less burdened and therefore less likely to overheat.
2. **CURRENT** (A) **-** here, just like in the case of POWER, the value on the new charger can be **equal to or higher** than the one stated on the laptop's label.
3. **VOLTAGE** (V) **-** the number with this parameter is more strictly required. Only a **variation of +/- 0.5V** is allowed on the new charger.

The last and equally important issue is the **PLUG**. Without it, you can't do anything! There are no exceptions here, **it's necessary for it to be identical to the original** . The given size indicates the outer diameter and inner diameter of the pin. If the comparison based on the presented photo is not enough, precise **measurement** will be necessary, which will ultimately **assure you in your choice**.
